

56532 Construction Project Management Tools

I would be grateful if you could provide the following details regarding your council's construction projects:

Common Data Environment (CDE) or Information Management Tool:

What Common Data Environment (CDE) platform(s) or Info Management tools, if any, does the council currently use to manage information and documentation for construction and infrastructure projects?

If applicable, please include the name(s) of the software/platform(s) and the remaining contract term.

We do not have a central platform or tool. For large Capital projects we run a CDE for project data. This is procured on a project-by-project basis and generally organised through the project team. This means we have used multiple platforms on different projects.

Field Tools:

What digital field tools or site-based software applications does the council use to support construction project delivery (e.g. for inspections, snagging, quality control, or field reporting)?

If applicable, please include the name(s) of the software/platform(s) and the remaining contract term.

We do not have a central digital field tool or software application for larger construction projects. For large Capital projects the Tier 1 contractors run their own CDE for construction stage data. We tend to use the contractor's site-based tools and are given access for our operatives to use this. This means we have used multiple platforms on different projects.

For smaller projects, we use 'Ed Controls' as a site-based tool for snagging and observations.

If you could also provide the name and contact information for the person responsible for information management, I would appreciate it.

We do not have a specific Information Management Officer or a named officer with responsibility for construction project management information.
